3. Why it is useful to work in a branch-pull-request workflow instead of working by directly committing each change to the main branch:

A branch-pull-request workflow is useful because it keeps new work isolated from the main branch until it's reviewed, reducing the risk of breaking shared code. It also encourages collaboration by allowing teammates to comment on changes, suggest improvements, and catch mistakes early. This leads to cleaner history, safer development, and higher-quality code.
